Completed

1. Executive Summary

The site suffers from a critically slow server response (over 5 seconds), which harms user experience and search rankings. Core SEO elements are missing on the vast majority of pages, including meta descriptions, canonical tags, and structured data, limiting visibility in search results. Accessibility gaps such as undeclared page language, unnamed links, and unlabeled form controls create barriers for users with disabilities. Additionally, robots.txt is blocking crawlers from 46 pages, and render-blocking scripts further delay page load.

Audit scope: Breadth-first internal crawl with static HTML inspection, response timing, payload measurement, technical SEO, metadata, accessibility, content, URL, and performance checks. Note: Scoring is derived from an internal crawl methodology and is not directly equivalent to third-party audit tool scores.

Top Priorities & What Needs To Be Done

- slow_response_time**
Why it matters: Server responses exceed 5 seconds, directly hurting Core Web Vitals, user retention, and search rankings.
To do: Optimize backend performance (caching, DB indexing, CDN) to bring response time under 200 ms.
- missing_meta_description**
Why it matters: 90 % of pages lack meta descriptions, reducing click-through rates from search results.
To do: Add unique, compelling meta descriptions (150-160 chars) to every indexable page.
- missing_canonical_tag**
Why it matters: Without canonical tags, duplicate content risks dilute ranking signals across 90 % of pages.
To do: Insert self-referencing canonical URLs on all pages and point duplicates to the preferred version.
- missing_structured_data**
Why it matters: No JSON-LD schema on 90 % of pages means missing rich-result opportunities and weaker entity understanding.
To do: Implement relevant schema (Organization, WebSite, Article, Product, etc.) via JSON-LD on each page.
- render_blocking_scripts**
Why it matters: 18 synchronous scripts block rendering on every page, inflating load time and hurting Core Web Vitals.
To do: Add async or defer attributes, move non-critical scripts to the footer, or load them via module scripts.
- missing_lang_attr**
Why it matters: Page language undeclared on 88 % of pages harms screen-reader users and SEO language targeting.
To do: Add <html lang="en"> (or appropriate language code) to every page template.
- unlabeled_form_controls**
Why it matters: 94 form controls lack accessible labels, creating major barriers for keyboard and screen-reader users.
To do: Associate each input with a <label> (for/id) or use aria-label/aria-labelledby attributes.
- blocked_by_robots_txt**
Why it matters: Robots.txt disallows crawling of 46 pages, preventing them from being indexed or ranked.
To do: Update robots.txt to allow crawler access to all public content and declare the sitemap URL.

16. Methodology & Limitations

Breadth-first internal crawl with static HTML inspection, response timing, payload measurement, technical SEO, metadata, accessibility, content, URL, and performance checks. Note: Scoring is derived from an internal crawl methodology and is not directly equivalent to third-party audit tool scores.

- Performance values are server-response and HTML payload measurements, not a Lighthouse lab run; LCP, CLS, INP, and TBT require browser instrumentation.
- Accessibility checks cover detectable markup only and do not replace keyboard, screen-reader, contrast, or WCAG conformance testing.
- Backlink authority, rankings, and traffic require external search-provider data and are not inferred by this crawler.
