

Website Performance, SEO & Technical Health Report

<https://www.amipi.com>

1. Executive Summary

The site suffers from critically slow server response times on nearly every page, which directly hurts user experience and search rankings. Most pages also lack fundamental SEO elements such as meta descriptions, canonical tags, and structured data, limiting visibility in search results. Accessibility gaps — including missing language declarations and unlabeled form controls — create barriers for users with disabilities. Addressing these high-impact issues will substantially improve performance, search traffic, and usability.

Audit scope: Breadth-first internal crawl with static HTML inspection, response timing, payload measurement, technical SEO, metadata, accessibility, content, URL, and performance checks.

Top Priorities & What Needs To Be Done

- slow_response_time**
Why it matters: Server responses average 7 seconds, causing high bounce rates, poor Core Web Vitals, and lower search rankings.
To do: Optimize backend code, enable caching, upgrade hosting, and implement a CDN to bring response times under 200ms.
- missing_meta_description**
Why it matters: 71 pages lack meta descriptions, so search engines generate snippets automatically, reducing click-through rates.
To do: Add unique, compelling meta descriptions (150-160 characters) to every indexable page.
- missing_canonical_tag**
Why it matters: Without canonical tags on 71 pages, duplicate content risks dilute ranking signals and confuse search engines.
To do: Implement self-referencing canonical tags on all pages and ensure consistent URL formatting.
- missing_structured_data**
Why it matters: No JSON-LD schema on any page means missed opportunities for rich results (e.g., products, articles, FAQs).
To do: Deploy relevant Schema.org markup (Article, Product, Organization, etc.) via JSON-LD on key templates.
- render_blocking_scripts**
Why it matters: 18 synchronous scripts block rendering on every page, delaying First Contentful Paint and interactivity.
To do: Add async/defer to non-critical scripts, inline critical CSS, and move non-essential JS to the footer.
- missing_h1_tag**
Why it matters: 37 pages lack an H1, weakening topical relevance for SEO and hurting screen-reader navigation.
To do: Ensure each page has a single, descriptive H1 that matches the primary keyword intent.
- missing_lang_attr**
Why it matters: 70 pages do not declare a language, causing screen readers to use wrong pronunciation and hurting accessibility compliance.
To do: Add lang="en" (or appropriate locale) to the <html> tag site-wide.
- unlabeled_form_controls**
Why it matters: 94 form controls lack labels, making forms unusable for keyboard and screen-reader users and violating WCAG.
To do: Associate every input, select, and textarea with a visible <label> or aria-label/aria-labelledby.

The full list of all **1132** findings across every single URL has been moved to a separate spreadsheet attachment to keep this document concise.

Full findings (1132 rows): see attached `amipi_findings_20260707_141614.csv`

11. Methodology & Limitations

Breadth-first internal crawl with static HTML inspection, response timing, payload measurement, technical SEO, metadata, accessibility, content, URL, and performance checks.

- Performance values are server-response and HTML payload measurements, not a Lighthouse lab run; LCP, CLS, INP, and TBT require browser instrumentation.
- Accessibility checks cover detectable markup only and do not replace keyboard, screen-reader, contrast, or WCAG conformance testing.
- Backlink authority, rankings, and traffic require external search-provider data and are not inferred by this crawler.
