1. Executive Summary

The crawl of amipi.com uncovered 1,132 issues across 71 pages, with the most severe being extremely slow server response times (averaging ~3.9 s) on nearly every page. Core SEO foundations are missing on the majority of pages: meta descriptions, canonical tags, structured data, and H1 headings are absent on 71, 71, 71, and 37 pages respectively. Accessibility gaps are widespread, including unlabeled form controls and links without accessible names on 70 pages each. Finally, 161 images lack ALT attributes and 16 external links return errors, which together degrade user experience, search visibility, and compliance.

Audit scope: Breadth-first internal crawl with static HTML inspection, response timing, payload measurement, technical SEO, metadata, accessibility, content, URL, and performance checks.

Top Priorities & What Needs To Be Done

- slow_response_time**
Why it matters: Pages load in ~4 seconds, causing high bounce rates, poor Core Web Vitals, and lower search rankings.
To do: Optimize server configuration, enable caching/CDN, and profile backend code to bring response time under 200 ms.
- missing_meta_description**
Why it matters: Search engines cannot generate compelling snippets, reducing click-through rates from SERPs.
To do: Add unique, keyword-rich meta descriptions (150-160 chars) to every page via CMS templates.
- missing_canonical_tag**
Why it matters: Duplicate content risk and diluted link equity across similar URLs.
To do: Insert a self-referencing canonical tag on each page; ensure consistent URL format (lowercase, no trailing slashes).
- missing_structured_data**
Why it matters: No JSON-LD schema means lost rich-result opportunities (e.g., products, articles, organization).
To do: Implement appropriate Schema.org markup (Organization, WebSite, BreadcrumbList, etc.) site-wide.
- unlabeled_form_controls**
Why it matters: 94 form fields per page lack labels, blocking screen-reader users and violating WCAG 2.1 AA.
To do: Associate each <input>, <select>, <textarea> with a <label> (for/id) or aria-label/aria-labelledby.
- unnamed_links**
Why it matters: 15 links per page have no accessible name, making navigation impossible for assistive tech.
To do: Provide descriptive link text or aria-label for every anchor; avoid empty <a> tags.
- broken_external_link**
Why it matters: 16 outbound links return 4xx/5xx errors, harming credibility and user trust.
To do: Audit and replace or remove broken external URLs; set up automated link-checking in CI.
- render_blocking_scripts**
Why it matters: 18 synchronous scripts delay first paint, compounding the slow response time.
To do: Add async/defer to non-critical scripts, inline critical CSS, and move third-party scripts to the footer.

URL Structure

Duplicate prevention and crawl efficiency

Recommended approach: Normalize URL casing and slashes, enforce one canonical version, and redirect alternatives.

SEVERITY	AFFECTED PAGE	FINDING
MEDIUM	https://www.amipi.com//sell/	URL contains repeated slashes Redirect to one normalized URL and update internal links. Security

A 1 findings

Visitor safety and browser trust

Recommended approach: Remove mixed content and deploy protective response headers after compatibility testing.

SEVERITY	AFFECTED PAGE	FINDING
MEDIUM	https://www.amipi.com	Missing Security Headers: HSTS Implement missing headers to protect against clickjacking, MIME-sniffing, and downgrade attacks. Fix: Add the Strict-Transport-Security header with a max-age of at least 31536000 seconds, includeSubDomains, and preload directives to your web server configuration (e.g., Nginx: `add_header Strict-Transport-Security "max-age=31536000; includeSubDomains; preload" always;`).

9. Performance Analysis

1798.5ms Average response	1531.3ms Median response	2579.6ms 95th percentile	70 Pages ≥1 second
592.2KB Average HTML payload	801.0KB Largest HTML payload	0 Failed page responses	{'200': 71} Status distribution

Interpretation: These are crawl-time response and HTML transfer measurements. They provide broad site coverage but are deliberately not presented as Core Web Vitals. Browser metrics such as LCP, CLS, INP, and TBT require a Lighthouse or Chrome UX measurement.

10. Page-Level Audit Inventory

Measured evidence for every crawled URL. This makes remediation and repeat-audit comparison possible.
